Auto Ticket Classification

Auto Ticket Classification workflow

Scenario

Submitting and automatically classifying an IT support ticket

Entice

How does someone initially become aware of this process?

Enter

What do people experience as they begin the process?

Engage

In the core moments in the process, what happens?

Exit

What do people typically experience as the process finishes?

Extend

What happens after the experience is over?

Steps

What does the person (or group) typically experience?

Need IT support | Open support channel | Create support ticket | Enter caller name | Enter short description

Student or teacher needs IT support | User starts the support request process | Support ticket is created with request details | Caller name is provided | Short Description is entered

Submit request | Ticket is created | Flow Designer starts | Analyze keywords | Identify issue type

Ticket request is submitted | New IT support ticket / incident request is created | Servicenow Flow Designer processes the ticket | Keywords in Short Description are analyzed | Issue type is identified

Assign category | Assign subcategory | Ticket is categorized

Category is assigned automatically | Subcategory is assigned automatically | Ticket now has classification details

Send email notice | Caller receives notice | Ticket details are available

Email notification is sent to the caller | Caller is informed about ticket creation | Categorized request can be reviewed by IT staff

IT staff handles request | Manual review is reduced | Requests are handled at scale | Future tickets follow the flow

IT staff can work with the categorized request | Less manual identification and categorization is needed | The automated approach is designed to be scalable | The same automated classification can be used for new requests

Interactions

What interactions do they have at each step along the way?

- **People:** Who do they see or talk to?
- **Places:** Where are they?
- **Things:** What digital touchpoints or physical objects would they use?

Student/teacher identifies an IT issue | Uses the IT support channel | Provides caller name and description | Enters caller name | Enters the Short Description

Submits the support request | Ticket/incident is created | Flow Designer receives the request | Keywords are checked in the description | Issue type is identified

Category is selected by the flow | Subcategory is selected by the flow | Ticket is updated with classification

System sends an email notification | Caller receives the notification | IT staff can access the categorized ticket

IT staff works on the support request | Manual review effort is reduced | Automation supports increasing request volume | Future requests use the same automated flow

Goals & motivations

At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

Help me get IT support started | Help me raise a support request | Help me provide the needed details | Help me describe the issue clearly | Help me submit the request

Help me get a ticket created | Help me avoid manual ticket handling | Help me classify the issue automatically | Help me identify the issue type | Help me get the right category

Help me get the right subcategory | Help me know the ticket is classified | Help me receive ticket confirmation

Help me know what was created | Help IT staff find categorized requests

Help reduce manual categorization | Help handle more request efficiently | Help keep the process scalable

Positive moments

What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?

Caller receives an email notification | No code Flow Designer approach | Consistent classification flow

Reproducible workflow | Designed to scale as requests increase | Less manual identification is needed

Less manual categorization is needed | Clearer ticket classification

Automated labelling of classifications

Ticket classification is automated | Category and subcategory are assigned

Negative moments

What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?

Multiple daily requests increase manual effort | Manual process becomes inefficient as requests increase | Caller waits for manual identification in the current solution | Current process depends on IT staff review

Manual review is time-consuming | Manual categorization can be error-prone

Increasing request volume is difficult to scale manually | Classification workload grows with request volume | Staff must identify the issue type manually in the current process | Manual identification and categorization take staff effort | Staff must select Category/Subcategory manually in the current process

Areas of opportunity

How might we make each step better? What ideas do we have? What have others suggested?

Reduce manual categorization effort | Add a no code reproducible workflow | Improve scalability as requests increase | Keep classification consistent | Support higher request volumes

Automatically assign Category and Subcategory

Use Short Description keywords for classification | Send an email notification automatically | Reduce manual review effort | Reduce frequent manual assignment | Use automation for future requests

Automate issue type identification | Create a repeatable ticket workflow
